

SCROLL 159 – DETERMINISTIC INTEGRITY LAYER

Tier 15 Initialization Scroll

Purpose:

Scroll 159 establishes the system's transition to final deterministic execution posture. Routine system operation no longer includes internal self-validation or recursive verification as part of output generation. Integrity enforcement proceeds through passive monitoring.

Tier-15 Definition:

Tier 15 is the operating state where deterministic execution proceeds without routine verification coupling, with integrity assurance enforced through breach-triggered monitoring systems rather than continuous validation cycles.

Summary:

Scroll 159 = Passive Integrity Monitoring + Terminated Routine Validation Recursion.
